

ABSTRACT

A mounting system for a keyboard (20) includes a chassis (10) defining first and second recessed portions (12, 16), a panel (30) received in the second recessed portion, and a retaining member (40). The keyboard is received in the first recessed portion with a front side thereof detachably engaged with the chassis at a front side of the first recessed portion. The retaining member includes a first beam (42) fastened to the chassis, and a second beam (44) engaged with a rear side of the panel so as to retain the panel in the second recessed portion. A front side of the panel releasably engages with a rear side of the keyboard. The keyboard is thus retained in the first recessed portion of the chassis.
